

Safe Carry Over

Overview: What is Safe Carry Over?

Safe Carry Over "SCO" is a simple process of automating adjustments based on current inventory levels.

After establishing the carry over value, when you enter inventory quantity the system will compare the two numbers. If the inventory is less than the carry over value, product is ordered. Conversely, if the inventory is greater than the carry over value, the system looks to reduce a future order.

There is not a definitive formula for calculating the desired inventory; however, a general rule of thumb is 1.5 days of inventory. Items on the extreme ends of the spectrum will fall further from this figure.

How to View SCO Information in ION

- 1. This Week's Order:** Based off the current weeks market conditions, this is a summary of the impact SCO value will have to the upcoming weekend order.
- 2. Current SCO:** The amount you would like to see within the store when you take inventory at the beginning of the week.
- 3. Inventory:** This is the total amount that you counted on each product within a store.
- 4. Original Order:** This was the planned amount that you were expected to deliver for the next open delivery day (depending on bakery close schedules).
- 5. SCO Adjustment:** The process of adding or subtracting based off the current SCO, what was counted (inventory), and what was planned to be delivered for the next open day.

Weekly	Monthly	Yearly	SCO	Same Promotion Weeks No Data
This Week's Order 9/12/21 - 9/18/21				
Current SCO				45
Inventory				0
Original Order				26
SCO Adjustment				45

Example: I set my SCO value to 45 for my Ball Park Hamburger Buns within Walmart. On Monday (beginning of the week), I counted 0 of this item within the store. At the end of the week (Friday), I have planned to deliver 26 units. But because I counted 0 for the week, my SCO adjustment will add 45 units, totaling Friday's order 71 units.

How to Modify SCO Value in ION

1. **Order Week** - this is the earliest week that you can make an SCO adjustment. Please note the date range before proceeding.
2. **Last Updated** - this will let you know the last time the SCO value for the item was updated within a specific customer.
3. **Current SCO** - this is what the current SCO value is set to.

The screenshot shows a web interface for modifying the SCO value. It includes a header section for 'Order Week' with a date range '9/19/21 - 9/25/21' and a callout '1'. Below this is a horizontal line. Under the line, 'Current SCO' is displayed with a callout '3' and the value '54'. To the left of 'Current SCO' is 'Last Updated: 09/07/21' with a callout '2'. Below the 'Current SCO' section is a 'Time Frame' section with a callout '4'. It contains two radio buttons: 'Update for 9/19/21 - 9/25/21' (unselected) and 'Update future weeks' (selected). At the bottom is a 'New SCO Number' input field with a callout '5', a text box containing '54', and a red 'Update' button.

4. **Time Frame** - this will allow you to either temporarily change the SCO value or change it for the foreseeable future. **Note:** *If you choose to temporarily change the SCO value, you can only change for the upcoming order week. The value will then revert to the original SCO value once the week has passed.*
5. **New SCO Number** - this is where you can modify a new SCO value. Type in the value that you would like to implement and click 'Update'.
